

MYSTICS PLATFORM

Admin Portal

Complete User Guide

Everything a platform administrator needs to know — written in plain English.

Mystics Platform Admin Console — secure OTP-based login

PLATFORM

Mystics Audit SaaS

VERSION

1.0 (July 2025)

AUDIENCE

How to Use This Guide

Read this first — it will save you a lot of time.

This guide covers every page and feature of the Mystics Audit Admin Portal — the control centre that platform operators use to manage all customer organisations, users, billing, system health, and more.

You do NOT need to be technical to use this guide. Each section explains:

- What the page does (in one sentence)
- When you would actually need it
- Exactly what to click, step by step
- What to watch out for — common mistakes and warnings
- Real-world examples and scenarios

Quick Orientation: Where Is Everything?

If you need to...	Go here
Log in / security	/admin login page & Security section
Manage customers	Tenants section
Help a struggling user	Support Console + Users section
Check if something broke	System Health + DB Monitor
Push a new feature	Feature Flags
Send a notice to users	Communications
Schedule maintenance	Maintenance Center
Fix a data problem	DB Admin (last resort)
Set up payments	Settings !' Payment Gateway

!9 WHO THIS GUIDE IS FOR

Platform Super-Admins: the people who operate the Mystics SaaS platform itself — not the end-customers of each tenant.

If you are a tenant user (someone who uses the Invoicing, GST, or AR features of the app), this guide is NOT for you. Contact your organisation's admin instead.

Table of Contents

1. Logging In	OTP-based login · who can access · troubleshooting login issues
2. Dashboard	Live platform KPIs · what each metric means · how to use it
3. Tenants	Create / suspend / activate / delete / bulk-manage customers
4. Tenant Detail	6-tab deep dive · modules · users · billing · custom pricing
5. Users	Cross-tenant user management · locks · password resets · roles
6. Billing	Plans · subscriptions · invoices · recording payments
7. Feature Flags	Controlled rollouts · kill switches · beta testing strategy
8. Audit Logs	What happened, when, and who did it · exporting · compliance
9. System Health	Is the platform OK? · active sessions · auth activity · diagnostics
10. DB Monitor	Database performance · slow queries · connection pool management
11. Security	Access control · active sessions · locked accounts · approvals
12. Operations Center	Background jobs · scheduled tasks · run history
13. Support Console	Help a tenant without their password · impersonation · data checks
14. Communications	Platform announcements · email testing · targeting by plan
15. Maintenance Center	Take platform offline safely · DB vacuum · cleanup tools
16. DB Admin	Direct database access · when to use · when to avoid it
17. Settings	Razorpay payment gateway · general platform configuration
18. Common Workflows	7 step-by-step playbooks for everyday admin tasks
19. Quick Reference Card	One-page cheat sheet of all key actions

1. Logging In

PAGE /admin

The Admin Portal is a completely separate application from the Mystics Audit app that your customers use. It has its own login page at /admin on your domain.

Instead of a password, it uses a one-time code (OTP) sent to your email each time you log in. This is much more secure — there is no password to be stolen or guessed.

Step-by-Step Login

- 1 Open your browser and go to /admin on your domain (e.g. <https://mystics-audit.replit.app/admin>).
- 2 Type your admin email address into the Email field.
- 3 Click Send OTP. Within a few seconds, you'll receive an email with a 6-digit code.
- 4 Type the 6-digit code from the email into the OTP field.
- 5 Click Verify OTP. You're now logged in.

The Admin Portal login screen — enter your email, then the OTP sent to it.

' OTP DIDN'T ARRIVE?

1. Check your spam/junk folder first.
2. Wait 30 seconds — email can be slightly delayed.
3. Click 'Send OTP' again to request a new code (the old code is cancelled).
4. Make sure you're using an email that is listed as an admin email. If unsure, contact your platform owner.

Who Can Log In?

Only email addresses listed in the PLATFORM_ADMIN_EMAILS setting (an environment variable on the server) can access the admin portal. If you try to log in with an email that isn't on that list, you'll see an 'Unauthorised' error.

Situation	What to do
Add a new admin email	Option A: Update PLATFORM_ADMIN_EMAILS env var on the server Option B: Go to Security !' Access Control !' Add Email
Remove admin access	Go to Security !' Access Control !' Delete the email
OTP time limit	You have 5 minutes to use the code after it's sent. After that, request a new one
Session length	You stay logged in until you click Logout (or clear your browser data)

High-Risk Actions Require a Second Verification

Some actions — like permanently deleting a tenant or changing security settings — are so serious that the portal asks you to verify your identity a second time, even though you're already logged in. You'll see a pop-up saying 'Please verify your identity to continue'. Just enter the OTP sent to your email, and you're good to proceed.

' RE-AUTHENTICATION OTP TIP

The re-auth OTP is valid for 15 minutes. You won't be prompted again during that window unless you perform another high-risk action.

2. Dashboard

PAGE / (home page after login)

The Dashboard is the first thing you see after logging in. Think of it as your platform's health board — a bird's-eye view of what's happening right now.

You don't need to do anything here; it's purely informational. But glancing at it daily takes just 10 seconds and can alert you to problems early.

What Each Number Means

KPI Card	Plain-English Meaning
Total Tenants	How many customer organisations have ever signed up on your platform.
Active Tenants	Customers who can currently log in and use the app (not suspended or deleted).
Trial Tenants	Customers on a free trial — they haven't started paying yet.
MRR	Monthly Recurring Revenue — the total amount you're billing customers per month combined.

The Charts

- Tenant Status Breakdown (pie chart) — shows the split between active / trial / suspended / deleted. If the 'suspended' slice is growing, you may have unpaid invoices piling up.
- Tenants by Plan (bar chart) — shows how many customers are on each pricing tier. Useful for understanding where your revenue comes from.

Recent Tenants & Activity

Below the charts, you'll see the last few tenants that signed up and the most recent actions anyone took on the platform. Click 'View all tenants' or 'View all logs' to see the full lists.

' BEST PRACTICE: MAKE THE DASHBOARD YOUR FIRST STOP

Log in, glance at the dashboard, then proceed to your actual task. If anything looks wrong (MRR dropped, lots of suspensions, error rate spiked), investigate before moving on.

3. Tenants

PAGE /tenants

This is your master list of all customer organisations on the platform. Every company that signs up for Mystics Audit is a 'tenant'. This page is where you'll spend most of your time as an admin.

Finding a Tenant

- Type a name or slug in the Search box to find a specific company.
- Use the Plan filter to list only Trial / Starter / Professional / Enterprise customers.
- Use the Status filter to list only Active / Suspended customers.
- Results are paginated — click the arrow buttons at the bottom to navigate.

!9 WHAT IS A 'SLUG'?

A slug is a short, URL-friendly identifier for the tenant — like 'acme-corp' or 'techwave-india'. It appears in the tenant's login URL. Each slug must be unique across the platform.

Creating a New Customer Tenant

When a new company signs up and you need to provision their account:

- 1 Click the New Tenant button in the top-right corner.
- 2 Fill in the organisation name (e.g. 'Acme Corp Pvt Ltd').
- 3 Fill in the slug (e.g. 'acme-corp') — must be lowercase, no spaces.
- 4 Select their plan (usually 'Trial' for new signups).
- 5 Select their state/location (used for GST compliance defaults).
- 6 Click Create. The tenant is live immediately.

& AFTER CREATING A TENANT

Creating a tenant just provisions the organisation. You also need to: (a) create at least one user for them — see the Users section, and (b) enable the right modules for them — see Tenant Detail !' Modules tab.

Actions You Can Take on Each Tenant ("i menu)

Action	What Happens
View Details	Opens the full detail page with 6 tabs of information and options.
Suspend	Immediately locks out all of this tenant's users. They see a 'suspended' screen. You'll be asked for a reason, which is shown to the tenant admin.
Activate	Re-enables access for a suspended tenant. Takes effect instantly.
Delete	Permanently and irreversibly deletes the tenant and ALL their data — invoices, users, journal entries, everything. Requires identity re-verification.

& SUSPEND VS DELETE — WHICH SHOULD I USE?

SUSPEND: Use this when a customer hasn't paid. They can't log in, but all their data is safe. When they pay, just Activate and they're back instantly.

DELETE: Only use this for demo/test tenants, or when a customer formally cancels and you've confirmed they no longer need their data. There is NO undo.

Bulk Actions — Handle Multiple Tenants at Once

Tick the checkbox on two or more tenant rows — a bulk action toolbar appears at the top of the list.

Bulk Action	What It Does
Bulk Suspend	Suspends all selected tenants at once. One shared reason message.
Bulk Activate	Reactivates all selected suspended tenants simultaneously.
Bulk Delete	Deletes all selected tenants permanently. Requires identity re-verification.

4. Tenant Detail

PAGE /tenants/:id

Click 'View Details' on any tenant to open this page. It has 6 tabs, each handling a different aspect of that tenant's account. Think of it as the full profile page for one customer organisation.

Tab 1 — Overview

Shows the tenant's name, plan, status, and key usage numbers (how many users, invoices, etc.). From here you can:

- Change Plan — move the tenant to a different pricing tier immediately.
- Extend Trial — add more days to a trial tenant without converting them to paid.
- Suspend / Activate — lock or restore access.
- Edit Name — rename the organisation.

🔗 EXTENDING A TRIAL

If a prospect says 'we need 2 more weeks to evaluate', go to their Overview tab ! 'Extend Trial !' enter 14 ! 'Save. Their trial end date updates instantly. You won't lose any data.

Tab 2 — License

Controls how many users this tenant is allowed to have. When their user count hits the limit, they can't add more users until you raise the limit or they upgrade their plan.

- 1 Go to the License tab.
- 2 Change the 'Max Users' number to whatever their contract allows.
- 3 Click Save. Takes effect immediately.

Tab 3 — Modules

Mystics Audit has 15 different modules (features). You can turn individual modules ON or OFF for each tenant — for example, if a tenant's plan doesn't include the Budget module, you can hide it entirely so they never see it.

The 15 modules are:

- 1. Dashboard
- 2. Chart of Accounts / GL
- 3. Invoicing
- 4. GST Management
- 5. AR (Accounts Receivable)
- 6. AP (Accounts Payable)
- 7. Bank & Cash
- 8. Expense Management
- 9. Purchase Management
- 10. Inventory / Digital Assets
- 11. Financial Reports
- 12. Audit Trail
- 13. Budget Management
- 14. User Management / RBAC
- 15. Settings

🔗 PRACTICAL EXAMPLE

A Starter plan customer shouldn't have Budget Management. Go to their Modules tab, find 'Budget Management', toggle it OFF. It disappears from their sidebar immediately. If they upgrade to Professional, toggle it back ON.

Tab 4 — Users

Lists all the users inside this specific tenant. You can:

- Create a new user for this tenant (name, email, role).
- Lock a user's account — they can't log in until you unlock.
- Reset a user's password — sends them a reset email.

Tab 5 — Billing

Shows subscription records and invoices for this specific tenant. To generate or record payment, use the main Billing section instead.

Tab 6 — Email Config

Allows you to decide whether this tenant can customise their own email (SMTP) settings. Toggle this ON if they want to send invoices from their own domain email. Leave it OFF if you want all emails to go through the platform's default email.

Custom Pricing (extra tab, enterprise tenants)

If a tenant has negotiated a custom monthly price (not the standard plan price), enter it here in paise. For example, ¹8,000/month = enter 800000. This overrides the plan's default price for billing purposes.

5. Users

PAGE /users

This page shows every user across all tenants in one list — useful when someone says 'my account isn't working' and you don't know which tenant they're from.

Finding a User

- Type a name or email in the Search box.
- Filter by tenant — use the dropdown to narrow down to one organisation.
- Filter by status: active / locked / suspended.

Creating a User for a Tenant

You typically create a user here when onboarding a new customer:

- 1 Click Create User (top right).
- 2 Select the tenant this user belongs to.
- 3 Enter their name and email address.
- 4 Choose their role:
 - Admin — can do almost everything inside the tenant, including managing other users.
 - Member — standard access to the modules they've been given permission for.
 - Viewer — read-only access. Can see data but not make changes.
- 5 Click Create. The user receives a password-reset email so they can set their own password.

Per-User Actions

Action	What It Does
Lock	Immediately prevents the user from logging in. You must enter a reason (e.g. 'Security concern awaiting investigation'). They see a 'locked' error when they try to log in.
Unlock	Restores login access. Takes effect immediately.
Reset Password	Sends a 'reset your password' link to the user's email. The link expires after 24 hours.
Edit Role	Changes the user's role (admin / member / viewer) within their tenant.
Module Permissions	Fine-grained overrides: for each module, you can set whether this specific user has Read, Write, or Admin access — overriding their role's defaults.

COMMON SUPPORT SCENARIO: USER CAN'T LOG IN

- Step 1 — Go to Users, search for their email.
- Step 2 — Check their status. If it says 'locked', click Unlock.
- Step 3 — Click Reset Password to send them a fresh link.
- Step 4 — Ask them to check their spam folder if they don't receive the email within 2 minutes.

6. Billing

PAGE /billing

Manage how customers pay for the platform. Three tabs: Pricing Plans, Subscriptions, and Invoices.

Tab 1 — Pricing Plans

Shows the 4 pricing tiers. You can view the features included in each plan. If you need to change what's included in a plan (e.g. increase the user limit for Starter), you would typically do that through a code change or by contacting your developer — it's not an editable form.

Plan	When to Use It
Trial	Free, time-limited. New customers start here.
Starter	First paid tier. Core modules for small teams.
Professional	All 15 modules. Suitable for mid-size IT companies.
Enterprise	Custom price, unlimited users, dedicated support.

Tab 2 — Subscriptions

A subscription links a tenant to a plan for a billing period. Every paying customer needs a subscription.

Creating a Subscription

- 1 Click New Subscription.
- 2 Select the tenant from the dropdown.
- 3 Select the plan.
- 4 Set the start date (usually today or the first of the month).
- 5 Set the billing cycle: Monthly (billed every month) or Yearly (billed once a year).
- 6 Optional: Enter a custom price in paise if this tenant has a special rate.
- 7 Click Create.

Tab 3 — Invoices

Generating an Invoice

- 1 Click Generate Invoice.
- 2 Select the tenant.
- 3 Select the billing period (month or year it covers).
- 4 Click Generate. The invoice is created and visible in the tenant's Billing tab.

Recording a Payment Received

- 1 Click Record Payment.
- 2 Select the invoice you're marking as paid.
- 3 Enter the amount paid, payment date, and method (UPI / card / bank transfer / offline cash).
- 4 Click Record. The invoice status changes to Paid.

🔁 MONTHLY BILLING WORKFLOW

First of the month: Go to Billing !' Invoices !' Generate Invoice for each active paid tenant.

Send the invoice to the tenant (you can download it as PDF from the Mystics Audit app).

When payment arrives: Record Payment on each invoice.

If a tenant hasn't paid by the 10th: Suspend their account until payment is received.

7. Feature Flags

PAGE /feature-flags

Feature flags are on/off switches for features in the application. They let you turn a new feature on or off for all tenants at once — without any code deployment. Think of them like light switches for features.

WHY FEATURE FLAGS MATTER

Scenario: Your developer released a new GST filing feature but wants to test it with 2 tenants before enabling for everyone.

Solution: The feature is hidden behind a flag called 'gst-filing-v2'. Keep it OFF. Enable it for 2 test tenants via DB Admin. Once confirmed working, flip the flag ON here — all tenants instantly get the feature.

Emergency: If a feature is causing errors, flip its flag OFF instantly — no code change, no deployment, no downtime needed.

Creating a Feature Flag

- 1 Click New Flag.
- 2 Enter a Key — a short, unique slug like gst-filing-v2 or dark-mode. No spaces.
- 3 Enter a Name — a human-readable label, like 'GST Filing V2'.
- 4 Enter a Description — explain what this flag controls.
- 5 Select a Category — helps you organise flags (billing, ui, integrations, etc.).
- 6 Set the initial state — usually start with Disabled.
- 7 Click Create Flag.

Managing Flags

- Toggle a flag ON/OFF — single click. Takes effect immediately for all tenants.
- Filter by category using the category pills at the top.
- Delete a flag with the trash icon — only do this if the code no longer references it.

Use Case	How to Implement It
Kill switch	Something broke in production. Flip the flag OFF !' feature hidden instantly, no deployment needed.
Beta rollout	Enable for 1-2 test tenants first via DB Admin, verify, then enable globally here.
Phased launch	Enable for trial tenants first, then paid tenants, finally all tenants.
Feature sunset	Disable before removing the code, so users stop seeing it immediately.

8. Audit Logs

PAGE /audit-logs

Every action taken by any user on the platform — logging in, creating an invoice, editing a vendor, approving an expense — is recorded here with a timestamp, the user who did it, and what changed. This log cannot be edited or deleted.

Use the Audit Log to answer: 'Who did that? When? What did it look like before?'

Filtering the Log

Without filters, you'll see hundreds of entries. Always narrow it down:

Filter	What It Narrows	Examples
Entity Type	What type of record was touched?	invoice, vendor, bill, expense, user, tenant, account, bank, budget
Action Type	What kind of change happened?	CREATE, UPDATE, DELETE, LOGIN, SUSPEND, ACTIVATE, POST VOID, REIMBURSE
Tenant	Which organisation?	Select from the dropdown — all tenants are listed
Date Range	When did it happen?	Set From and To dates to narrow down a time window

READING A LOG ENTRY

Each row shows: timestamp, user email, tenant name, entity type, action, and a short description.

Click any row to expand it and see the BEFORE and AFTER values — exactly what changed in the data.

Example: 'vendor record ID 42 — BEFORE: {name: 'Infosys', isMsme: false} — AFTER: {name: 'Infosys', isMsme: true}'

This tells you that user john@acmecorp.com changed the MSME flag for Infosys vendor on 5 July at 14:32.

Common Audit Log Queries

Question	How to Query It
Who deleted this invoice?	Filter: entity=invoice, action=DELETE, tenant=their org, date=when it went missing
Did they really change that vendor?	Filter: entity=vendor, action=UPDATE, tenant=their org
Who logged in yesterday?	Filter: action=LOGIN, date=yesterday
What did this user do last week?	Filter: tenant=their org, date=last week. Search for their email in results.
Show all failed actions	Filter: action=any, look for rows with a red ' status icon

Exporting for Compliance / Reports

- 1 Set your filters to narrow down to the entries you need.
- 2 Click Export CSV — downloads a spreadsheet with all matching rows.
- 3 Use for: annual compliance audits, customer data requests, GSST/tax investigation support.

9. System Health

PAGE /health

This page answers the question: 'Is the platform working correctly right now?' It shows live metrics that auto-refresh every 30 seconds. You don't need to be technical to read the key indicators.

The Six Tabs — Plain English

Tab	What It Tells You (plain English)
Overview	The summary view. Shows uptime, database response time, how many users are logged in, and the error rate. This is your quick check tab.
Performance	A chart of how busy the platform has been in the last 24 hours — spikes are normal during business hours. Also shows email queue size (are notification emails going out?).
Sessions	Lists every user currently logged into the Mystics Audit app. From here you can force-logout a user or unlock a locked account.
Auth Activity	Recent login attempts — including failed ones. If you see many failed logins for one email, investigate.
API Stats	Which pages are being used most? Which API calls are slowest? Useful for performance investigation.
Diagnostics	Deep technical check — database pool status, whether all migrations ran, file system space, environment variables present. Run this after a deployment.

' WHAT TO LOOK FOR ON A HEALTHY PLATFORM

- ' DB Ping: under 50ms
- ' Error Rate: 0% or < 0.5%
- ' Active Sessions: any reasonable number
- & Anything red or 'Critical' in the Diagnostics tab needs immediate attention.

Unlocking a User Account from System Health

If you know a user is locked but you're already on the Health page, you don't need to go to Users. Just:

- 1 Click the Sessions tab.
- 2 Find the locked user.
- 3 Click Unlock next to their name.

10. DB Monitor

PAGE /monitoring

The database is the heart of the platform — everything is stored there. This page monitors its performance in real time (updates every 5 seconds). You use this when things feel 'slow' or when System Health flags a problem.

The KPI Cards — What's Normal?

KPI	What It Means	Healthy Range
DB Ping	How fast the database responds	Under 20ms is great, 20–100ms is fine, over 100ms investigate
Connections	Active DB connections right now	Should be under 8 out of 10. If it's 10/10, the app may freeze
Cache Hit	Data served from memory (fast)	Should be over 95%. Lower means more disk reads = slower queries
Slow Queries	Queries taking more than 1 second	Target: 0. Even 1 means something needs attention
Deadlocks	Conflicting queries stuck waiting	Target: 0. Any deadlock is a bug
DB Size	Total storage used	Just for awareness — keep an eye on growth trends

The Connection Pool — What to Do When It's Full

If all 10 connections are in use ('10/10 active'), new requests from the application will queue up and the app will become slow or unresponsive. Here's how to fix it:

- 1 Scroll to the Connection Pool panel on this page.
- 2 Look for connections that have been running for a long time (minutes) in a non-idle state.
- 3 Click Terminate next to the oldest stuck connection.
- 4 That frees up one slot. The active count drops by 1 immediately.
- 5 If the problem keeps recurring, there is likely a long-running query in the app code — note the query text and report it to your developer.

!9 DON'T PANIC ABOUT BRIEF SPIKES

Connection count reaching 8/10 briefly during peak hours is normal. Only worry if it stays at 10/10 for more than a minute, or if DB Ping climbs above 200ms consistently.

11. Security

PAGE /security

Manage who has admin access, review active sessions, handle locked accounts, and approve sensitive tenant requests. The Security section is where you control who can do what on the platform.

Tab 1 — Overview

A summary card showing: security score, number of active admin sessions, locked user accounts, and pending approvals. Links to each detail tab. Check this weekly.

Tab 2 — Sessions

Shows every active admin console session — including yours. If you ever suspect your admin session was compromised, terminate all sessions here (including yours) and log in fresh.

Scenario	What to Do
Who is logged in?	Check the Sessions tab — lists email, IP, device, and last activity.
Someone else is logged in?	Click Terminate next to their session. They're immediately logged out.
Terminate all sessions	Use the 'Terminate All' button. Everyone (including you) must re-login.

Tab 3 — Access Control

This is the definitive list of who can log into the admin portal. Two sub-panels:

- Authorized Emails — the whitelist. Only emails listed here can log in.
- Admin Users — a record of all admin accounts (including yourself).

Adding a New Admin

- 1 Go to Security > Access Control.
- 2 In the 'Add Authorized Email' form, enter the new admin's email and name.
- 3 Click Add. They can now log in immediately using OTP.

Removing Admin Access

- 1 Find their email in the Authorized Emails list.
- 2 Click the trash icon next to their email.
- 3 They will be unable to log in from the next attempt onwards (existing sessions are not immediately terminated — use the Sessions tab to kill those).

Tab 4 — Locked Accounts

When a user fails to log in too many times, their account is automatically locked. This tab lists all locked accounts across all tenants.

- 1 Find the user's email in the list.
- 2 Review the reason (how many failed attempts, when it was locked).
- 3 Click Unlock to restore their access.

Tab 5 — Approvals

Some tenant actions (like bulk data exports) require your approval before they go through. This tab lists pending requests.

- Click Approve to allow the action.
- Click Reject to deny it. You can add an optional reason that the tenant admin will see.

12. Operations Center

PAGE /ops

Background jobs are tasks that run automatically in the background — like sending reminder emails or generating monthly invoices. This page lets you see what's scheduled, trigger jobs manually, and review past runs.

Common Background Jobs

Job	What It Does	When to Run
cleanup-expired-sessions	Removes old login sessions from the database. Keeps the session table small.	Runs automatically. Run manually if the DB sessions table is growing large.
send-trial-expiry-warnings	Emails tenants whose free trial is about to end (within 2-7 days). Prompts them to upgrade.	Runs daily. Run manually if you want to immediately notify trial tenants.
generate-monthly-invoices	Automatically creates billing invoices for all paid subscriptions at the start of the month.	Runs on the 1st of each month. Run manually if it didn't fire for some reason.
data-consistency-check	Scans for data errors: orphaned records, missing GL entries, broken references.	Run manually when you suspect a data problem after an import or migration.

Running a Job Manually

- 1 Find the job in the list.
- 2 Click the Run button.
- 3 A spinner shows while it runs — wait for it to complete.
- 4 The status updates to 'Success' or 'Error' with a timestamp.
- 5 If it errored, scroll to the Job Run History at the bottom to see the error details.

Job Run History

Shows every past job execution: date/time, which job, how long it took, and whether it succeeded or failed. Use this to verify that your scheduled jobs are actually running — if a job that should run daily shows nothing for 3 days, it may be broken.

!9 NO JOB OUTPUT VISIBLE?

If a job completed with 'Success' but you expected something to change (e.g. invoices generated) and nothing happened, it might mean there were no matching records (e.g. no active paid subscriptions). That's normal — 'Success' means the job ran without errors, not that it processed anything.

13. Support Console

PAGE /support

This is your diagnostic toolkit for helping individual tenants when something goes wrong in their account — without needing to ask for their password or log into their account manually.

How to Use the Support Console

- 1 Select the customer organisation from the left-side panel.
- 2 Look at the Data Integrity check — it automatically scans for known data problems in that tenant.
- 3 Look at the Recent Activity feed — shows what this tenant's users were doing before the issue occurred.
- 4 If you need to reproduce the problem yourself, generate a Support Access Token (see below).
- 5 If you find a data issue, use DB Admin to fix it (as a last resort, with caution).

Data Integrity Check

Automatically scans the selected tenant for common data problems:

- Orphaned invoices — invoices not linked to a customer.
- Missing GL entries — transactions without corresponding journal entries.
- Unbalanced journals — debit and credit amounts don't match.
- Broken foreign key references — records pointing to deleted items.

Click Run Check to refresh the scan. Click Fix next to any issue to auto-resolve it if an automatic fix is available.

Support Access Token — Logging In As a Tenant

Sometimes you need to actually see what the tenant sees to understand their problem. The Support Access Token lets you log in as that tenant without knowing their password:

- 1 Select the tenant in the left panel.
- 2 Click Issue Token.
- 3 Copy the token that appears — it's only shown once and expires in 1 hour.
- 4 Open the Mystics Audit app in a new browser tab.
- 5 Use the token to log in as that tenant.
- 6 You can now see exactly what they see and reproduce the issue.
- 7 When done, log out of the tenant view.

& ACCOUNTABILITY: SUPPORT ACCESS IS ALWAYS VISIBLE TO THE TENANT

Everything you do while using a Support Access Token is recorded in that tenant's Audit Trail with the tag 'Support Access'. The tenant's admin can see that a platform support agent logged in and exactly what they did. Be professional — only access what's needed to solve the issue.

14. Communications

PAGE /communications

Post announcements that appear as banners inside the Mystics Audit application for all tenants (or a specific subset), and test that the platform's email delivery is working correctly.

Posting an Announcement

Announcements appear as coloured banners at the top of the Mystics Audit app. Tenants cannot dismiss them — they stay visible until you deactivate them. Use them for:

- Planned maintenance windows — 'The platform will be offline Sunday 2–4am IST for upgrades.'
- Important legal/policy changes — 'Our terms of service have been updated...'
- Feature announcements — 'New: GST Filing V2 is now live for your account.'

Step-by-Step

- 1 Enter a Title — short, clear (e.g. 'Scheduled Maintenance This Sunday').
- 2 Enter a Message — full explanation. Keep it under 150 words — tenants skim long messages.
- 3 Choose the Type:
 - Info (blue) — neutral information, e.g. new feature announcement.
 - Warning (yellow) — something that needs user attention, e.g. upcoming maintenance.
 - Success (green) — positive news, e.g. 'Issue resolved'.
 - Error (red) — something is broken right now.
- 4 Choose the Target Audience:
 - all — every tenant sees the banner.
 - admins — only admin-role users within each tenant.
 - trial — only customers on the free trial.
 - paid — only customers on paid plans.
- 5 Click Post Announcement.

Managing Announcements

- Toggle the switch to instantly activate or deactivate an announcement.
- Delete with the trash icon. Confirm when prompted.
- Edit? Delete and recreate (announcements can't be edited after posting).

SMTP Test

The platform sends emails for: OTP codes, password resets, invoice notifications, trial expiry warnings. If these emails stop arriving, use the SMTP Test to diagnose:

- 1 Click Test SMTP.
- 2 A test email is sent to your admin email using the configured SMTP settings.
- 3 If it succeeds, email delivery is working. If it fails, you'll see an error message — check the SMTP credentials in Settings !' General Settings.

15. Maintenance Center

PAGE /maintenance

Tools for taking the platform offline safely during planned maintenance, running database housekeeping, and scanning for data integrity problems.

Global Maintenance Mode

When you enable maintenance mode, ALL tenants immediately see a 'We're doing maintenance' screen and cannot use the app. Use this before:

- Running database migrations (schema changes).
- Doing a major server deployment.
- Running VACUUM or REINDEX on large tables.

- 1 Write a clear message for users — e.g. 'We are upgrading our servers. The platform will be back at 4:00am IST. Sorry for the inconvenience.'
- 2 Click Enable Maintenance. Confirm when prompted.
- 3 Perform your maintenance work.
- 4 Click Disable Maintenance when done. All tenants regain access instantly.

' PRE-MAINTENANCE CHECKLIST

1. Post an announcement 24 hours before (Communications page) so users know in advance.
2. Pick a low-traffic time — weekday nights after 11pm or weekend mornings before 8am.
3. Have your maintenance work ready to execute immediately after enabling the mode.
4. Do a final test after disabling — log in as a tenant to confirm everything works.

Per-Tenant Maintenance Mode

Put just one tenant offline (without affecting others). Useful when fixing a data issue specific to that tenant that requires temporary read-only access. Find the tenant in the list, toggle their switch, and optionally add a message.

Database Maintenance Tools

Tool	What It Does	When / How to Use It
VACUUM	Cleans up 'dead' rows left behind after deletes and updates. Reclaims disk space and	Leave the table name blank to run on the entire database. Run during low traffic periods.
REINDEX	Rebuilds database indexes that have become 'bloated' over time, which makes queries slower.	Run on specific tables if you notice slow queries on that table. Brief table locks may occur.

Cleanup Tools

Tool	Purpose	When to Use
Log Cleanup	Deletes old audit log entries older than N days.	Run monthly if the audit log table is growing very large. Keep at least 12 months for compliance.
Session Cleanup	Removes expired session records from the database.	Run weekly or when the DB size is growing unexpectedly.
Cache Clear	Clears specific in-memory application caches.	Use if you've made configuration changes that aren't reflecting in the app.

16. DB Admin

PAGE /database

Direct access to every database table — you can read, create, edit, and archive any record. This is a powerful tool and should be used carefully. Most day-to-day operations should be done through the application's normal UI instead.

When to Use DB Admin

	Examples
' Appropriate uses	Fix a typo in a record that the UI won't let you edit Correct a field value that was set incorrectly during import
'L Avoid using for	Deleting financial records (invoices, journal entries) — use Void/Cancel in the app Changing invoice or bill status fields — use the proper Post/Pay/Void workflow Verifying field values during a support investigation Bulk updates across many rows — write a migration script instead Anything you're not sure about — ask your developer first

Browsing a Table

- 1 Select a table from the left sidebar (alphabetical list of all tables).
- 2 The right panel shows that table's rows — columns are displayed left to right.
- 3 Click the filter icon (funnel) above any column to filter rows by that column's value.
- 4 Use the pagination arrows at the bottom to navigate through large tables.
- 5 Click a column header to sort the rows by that column.

Editing a Record

- 1 Find the row you want to edit.
- 2 Click the pencil (edit) icon on that row.
- 3 An inline editor appears — change the values you need to fix.
- 4 Click Save. The change is written to the database immediately — no undo.

Creating a Record

- 1 Click the + (create) icon in the table header.
- 2 Fill in the required fields. Required fields are marked with *.
- 3 Click Create Record.

Archiving a Record

Click the archive icon on a row. Enter a reason for the archive (this is recorded in the audit log). Click Confirm. The record is soft-deleted — it's marked as archived but still exists in the database and can be retrieved if needed.

& RULE OF THUMB FOR DB ADMIN

If you can accomplish the same thing through the normal app UI, use the app. Only fall back to DB Admin when the app's UI doesn't allow the specific change you need. When in doubt, take a screenshot of the current state before editing, so you can undo manually if needed.

17. Settings

PAGE /settings

Two tabs: General Settings (platform configuration) and Payment Gateway (Razorpay setup for accepting payments).

Tab 1 — General Settings

Platform-wide configuration options grouped by category. Each setting saves independently.

- 1 Find the setting you need to change (settings are listed with their category and key).
- 2 Click into the value field and change it.
- 3 Click Save next to that specific setting. A green tick confirms it saved.

!9 SETTINGS AREN'T INSTANT

Some settings (especially email and security settings) take effect immediately. Others may require restarting the application server to take effect. If you change a setting and nothing changes, try restarting the app workflow.

Tab 2 — Payment Gateway (Razorpay)

Before you can collect subscription payments, you need to configure Razorpay. Get your credentials from <https://dashboard.razorpay.com> under Settings !' API Keys.

Field	What It Is	How to Get It
Key ID	Starts with rzp_test_ (test) or rzp_live_ (production)	Paste from Razorpay dashboard
Key Secret	Generated alongside the Key ID	Paste from Razorpay dashboard. Keep this secret.
Webhook Secret	Created under Razorpay !' Settings !' Webhooks	Needed for payment confirmation callbacks
Mode	test or live	Use 'test' during development, switch to 'live' before going live with real customers

- 1 Enter all four values.
- 2 Click Save Payment Gateway.
- 3 Click Test Connection — if it shows 'Connected successfully', you're ready.
- 4 If the test fails, double-check the Key ID and Key Secret for typos.

& TEST MODE VS. LIVE MODE

Test mode: Use rzp_test_ keys. Payments go through Razorpay's test environment — no real money moves. Use during development and QA.

Live mode: Use rzp_live_ keys. Real payments are collected. Switch to this ONLY when you're ready to charge real customers.

You can switch back and forth, but be aware that subscriptions and invoices created in test mode won't have real payment records.

18. Common Workflows

Complete step-by-step playbooks for the most frequent admin tasks. Bookmark this section.

Workflow 1 — Onboarding a New Customer

When a company signs up and you're ready to activate their account:

- 1 Tenants !' New Tenant. Enter org name, slug (e.g. 'acmecorp'), plan ('Trial'), location.
 - 2 Click Create.
 - 3 Open the new tenant !' View Details.
 - 4 Modules tab: Enable only the modules included in their contract.
 - 5 License tab: Set the Max Users limit.
 - 6 Users tab (or main Users page): Create their first admin user — name, email, role 'admin'.
 - 7 Billing !' New Subscription: Create their subscription record.
 - 8 Tell the customer to check their email for a password reset link.
 - 9 Confirm with them that they can log in and see their modules.
-

Workflow 2 — Suspending a Non-Paying Customer

- 1 Billing !' Invoices: Confirm the invoice is genuinely overdue (not just pending).
 - 2 Tenants !' find the tenant !' "I !' Suspend.
 - 3 Enter reason: 'Invoice #INV-2025-042 overdue. Please make payment to restore access.'
 - 4 Click Suspend. Their users immediately see a suspension notice.
 - 5 Communications (optional): Post an announcement targeting that tenant admin.
 - 6 When payment is received: Tenants !' find tenant !' Activate.
 - 7 Billing !' Record Payment on the invoice.
-

Workflow 3 — Handling a Support Ticket ('Something is Wrong')

- 1 Ask the customer: what page were you on, what did you do, what did you expect to see vs. what actually happened?
 - 2 Check Audit Logs: filter by their tenant and the time of the incident. Find the relevant action.
 - 3 Support Console: select their tenant, click Run Check on Data Integrity.
 - 4 If the issue is a data problem (missing record, wrong value): use DB Admin to investigate and fix if safe.
 - 5 If you need to reproduce the issue: Support Console !' Issue Token !' log in as the tenant.
 - 6 Once fixed: test in their tenant that the issue is resolved.
 - 7 Close the ticket and communicate the resolution to the customer.
-

Workflow 4 — Emergency: Platform Is Down or Breaking

- 1 System Health !' Overview: check error rate and DB ping for obvious indicators.
 - 2 DB Monitor: check if connections are maxed out or there are slow queries.
 - 3 If a bad deployment caused it: consider enabling Global Maintenance Mode while you fix it.
 - 4 Feature Flags: if a specific feature is causing the problem, toggle its flag OFF immediately.
 - 5 Once the issue is identified and fixed: Disable Maintenance Mode if it was enabled.
 - 6 Communications: post an 'Issue Resolved' success announcement to all tenants.
 - 7 Audit Logs: check what happened in the minutes before the outage for clues.
-

Workflow 5 — Planned Maintenance Deployment

- 1 24 hours before: Communications !' Post Warning announcement: 'Maintenance this Sunday 2–4am IST'.
 - 2 At maintenance time: Maintenance Center !' Enable Global Maintenance Mode.
 - 3 Deploy your code / run your migrations / do your maintenance work.
 - 4 Test: open the Mystics Audit app in a private browser, log in as a test tenant, confirm it works.
 - 5 Maintenance Center !' Disable Maintenance Mode.
 - 6 Communications !' Post Success announcement: 'Platform is back online.'
 - 7 System Health !' Check the Diagnostics tab: confirm all DB migrations ran.
-

Workflow 6 — Resetting a User's Password

A tenant's employee forgot their password or their account is locked:

- 1 Users !' search for the user by email.
 - 2 If Status is 'Locked': click Unlock first.
 - 3 Click Reset Password. A reset email is sent immediately.
 - 4 Ask the user to check their inbox (and spam folder).
 - 5 If they still don't get the email: Communications !' SMTP Test — confirm email is working.
-

Workflow 7 — Rolling Out a New Feature Gradually

- 1 Developer releases the feature behind a flag (disabled by default). Confirm the flag key name with them.
- 2 Feature Flags !' confirm the flag exists and is set to Disabled.
- 3 DB Admin !' feature_flags table: enable the flag for 1–2 specific test tenant IDs to verify.

- 4 Log in as one of those test tenants (Support Console !' Issue Token) and confirm the feature works.
- 5 Feature Flags !' toggle the flag ON globally. Feature is now live for all tenants.
- 6 Monitor System Health !' Performance for the next 30 minutes for any error spikes.

19. Quick Reference Card

Tear-out cheat sheet for everyday admin tasks

Page Map

URL Path	What's There
/admin	Login page
/	Dashboard — platform KPIs
/tenants	All customer organisations
/tenants/:id	One tenant — 6 tabs (overview, license, modules, users, billing, email)
/users	All users across all tenants
/billing	Plans, subscriptions, invoices, payments
/feature-flags	Feature on/off switches
/audit-logs	Complete action history — who did what, when
/health	Platform health — sessions, auth, performance, diagnostics
/monitoring	Database performance — connections, slow queries
/security	Access control, locked accounts, active sessions, approvals
/ops	Background jobs — run manually or view history
/support	Tenant diagnostics, data integrity, impersonation
/communications	Announcements + SMTP test
/maintenance	Maintenance mode, VACUUM, REINDEX, cleanup
/database	Direct DB table browser and editor
/settings	General config + Razorpay payment gateway

Most-Used Actions — At a Glance

New customer signup	Tenants !' New Tenant !' Create Tenant Detail !' Modules tab !' enable their modules Users page !' Create User Billing !' New Subscription
Suspend non-paying customer	Tenants !' "i !' Suspend !' enter reason
Reactivate suspended customer	Tenants !' "i !' Activate
User can't log in	Users !' find by email !' Unlock + Reset Password
Platform is slow	DB Monitor !' check connections & slow queries
Something looks broken	System Health !' Overview !' check error rate Feature Flags !' toggle off any new feature
Customer asks 'what happened?'	Audit Logs !' filter by their tenant + date range
Planned maintenance	Communications !' announce 24h before Maintenance Center !' Enable !' do work !' Disable
Enable new feature for all	Feature Flags !' toggle flag ON
Tenant needs more users	Tenant Detail !' License tab !' increase Max Users
Invoice marked as paid	Billing !' Record Payment !' select invoice
SMTP / email not working	Communications !' Test SMTP Settings !' check SMTP config

' KEYBOARD SHORTCUT — COMMAND PALETTE

Press Ctrl+K (Windows) or Cmd+K (Mac) anywhere in the Admin Portal to open the command palette. Type any page name or action and jump directly to it — faster than clicking through the sidebar.

!9 WHEN IN DOUBT

Ask yourself: 'Can I do this through the normal app UI?' — if yes, use the app, not DB Admin.

Ask yourself: 'Is this reversible?' — if no, double-check with a colleague before proceeding.

Check the Audit Logs AFTER any change to confirm it was recorded correctly.
